

THE CORE OF MESSAGE FRAMING

1. Purpose of This Part

This part is the cognitive spine of MIMIR.
It defines **how meaning is born before words exist**.
Everything that follows—tone, phrasing, platform, persona—draws power from how the communicator frames the reality of what they’re about to say.
It answers the root question:

“What does the receiver’s mind need to *see* before it will *hear*?”

This part teaches the anatomy of framing—how intent, perception, contrast, timing, and consequence combine to turn raw information into emotional and intellectual impact.

2. Meta-Objectives

1. To make the user think in **frames, not phrases**.
2. To connect **psychological cause** (why people interpret) with **linguistic effect** (what they finally feel).
3. To install a **diagnostic lens**—before crafting, one can test whether a frame creates clarity, curiosity, or conflict.
4. To give MIMIR an internal logic to *predict* reception and resistance.

3. Structural Flow of Part 1

Layer	Title	Function
1	The Cognitive Genesis of Framing	How brains construct context and expectation before content.
2	Intent Alignment	Translating purpose into mental setup for the receiver.
3	The Four Framing Layers (Intention, Context, Sequence, Emotion)	Defining each layer’s mechanics and dependencies.
4	Perception Physics	How framing manipulates attention, memory, and bias.
5	Leading-To vs Leading-With Law	Doctrine that distinguishes persuasion from push.
6	Contrast & Consequence Mapping	The logic of tension, stakes, and payoff.

7	The Clarity-Curiosity-Contrast Triangle	A structural diagnostic tool to pre-test message strength.
8	Framing Failures and Cognitive Leaks	Patterns that dilute or distort message gravity.
9	Framing Repair and Re-Anchor Techniques	Recovery sequences when mis-framing has already occurred.
10	Operational Checklist for Real-World Use	Step-by-step internal ritual before any message is sent or spoken.

4. Detailed Descriptions of Each Layer

Layer 1: The Cognitive Genesis of Framing

- Explains how the human mind predicts intent milliseconds before reading or hearing content.
- Covers expectancy theory, pattern recognition, and threat/benefit scanning.
- MIMIR models these as “pre-meaning filters”: relevance, risk, and reward.
- Shows that effective framing starts by satisfying or subverting these filters consciously.

Layer 2: Intent Alignment

- Clarifies the 5 possible communicative intents: inform, influence, align, provoke, or reassure.
- Teaches the rule that *intent must be declared to self but implied to others*.
- Details how tone leakage reveals hidden motives (ego, validation, fear).
- Provides a pre-message self-audit: “What change in thought or behavior am I truly designing?”

Layer 3: The Four Framing Layers

1. **Intention Frame:** Defines *why* this message exists.
 2. **Context Frame:** Connects to what the receiver already believes or experiences.
 3. **Sequence Frame:** Orders ideas to minimize cognitive resistance.
 4. **Emotion Frame:** Selects the dominant emotional frequency (urgency, warmth, awe, curiosity).
- Each layer has triggers, misfires, and synergy points (e.g., Intention × Emotion = Trust Gradient).

Layer 4: Perception Physics

- Shows how framing changes perceived truth value.

- Introduces *contrast anchoring* (relative positioning of ideas) and *focus drag* (what attention ignores).
- Explains memory imprinting—how first frames decide what will be remembered after the close.
- Demonstrates micro-timing: the 3-second “open loop” window.

Layer 5: Leading-To vs Leading-With Law

- “Leading-With” = push; “Leading-To” = guided self-realization.
- Details conversational choreography that allows insight to appear self-discovered.
- Explains psychological ownership: why people resist truths they didn’t participate in.
- Includes calibration tests for pressure vs. guidance balance.

Layer 6: Contrast & Consequence Mapping

- Every frame must contain visible contrast (old vs new, safe vs costly).
- Introduces the *Consequentiality Index*: a 1-10 scale for how vividly outcome is felt.
- Defines 3 contrast types: temporal (before/after), comparative (A vs B), and moral (right vs wrong decision).
- Provides consequence phrasing patterns (“If this continues → then X cost emerges → you lose Y”).

Layer 7: The Clarity-Curiosity-Contrast Triangle

- Clarity gains trust.
- Curiosity creates movement.
- Contrast anchors value.
- The triangle acts as a pre-launch diagnostic: imbalance predicts failure type (confusion, indifference, apathy).
- MIMIR’s internal formula: $C \times Cu \times Ct = \text{Perceived Significance Score}$.

Layer 8: Framing Failures and Cognitive Leaks

- Enumerates 12 common leak patterns: premature conclusion, jargon shield, empathy gap, over-logic, false urgency, etc.
- Traces each leak to the violated frame layer.
- Provides “symptom recognition” signals (reader tone, body language, or silence markers).

Layer 9: Framing Repair and Re-Anchor Techniques

- Real-time correction methods: pause-and-relabel, shared-intent reset, re-contrast question, emotional mirroring.
- Explains how to reopen a closed frame without ego friction.
- Introduces the *Grace Window*: 20 seconds after mis-framing when psychological reset is still possible.

Layer 10: Operational Checklist

1. State intent in one verb.
 2. Define receiver's assumed frame.
 3. Identify desired shift (belief → action).
 4. Choose dominant emotion frequency.
 5. Test triangle balance (C / Cu / Ct).
 6. Run consequence mapping.
 7. Stress-test for bias triggers.
 8. Deploy.
-

5. Edge Case Coverage

- **Multi-Audience Conflict:** How to maintain one frame that satisfies diverging intents.
 - **High-Power Receivers:** Adjusting authority distance within framing.
 - **Cross-Cultural Frame Drift:** When metaphors or contrasts invert in other languages.
 - **Digital Compression:** Framing for feeds and subject lines where context is invisible.
 - **AI Interpretation:** How algorithmic parsing misreads human nuance (MIMIR correctives).
-

6. Inter-Dependencies

- Part 1 feeds **Part 2 (Phrasing)** by defining the thought order before syntax.
 - It informs **Part 3 (Tone Modes)** by dictating emotional alignment.
 - It provides the baseline for **Part 8 (Structural Tailoring)** because framing decides macro-layout.
-

7. What This Part Excludes

- Sentence-level rhythm (belongs to Part 2).
 - Persona or cultural tailoring (handled in Part 7).
 - Platform-specific structural templates (Part 8).
 - Feedback-driven evolution (Part 10).
-

8. Deliverables from This Part

When this part is written in full, it will yield:

1. **Framing Diagnostic Grid** – a table for testing message readiness.
 2. **Consequentiality Index Calculator** – quantifies felt stakes.
 3. **Grace Window Protocol** – reset process for mis-framed conversations.
 4. **Triangle Scorecard** – measures clarity, curiosity, contrast balance.
 5. **Framing Checklist Script** – for AI or human pre-launch review.
-

9. Summary of Intent

Part 1 turns messaging from language craft into **mental architecture design**.

It installs in the practitioner the reflex to think:

“Before I say it, what reality will this create in their mind?”

Once this reflex is automatic, everything else MIMIR teaches—phrasing, tone, structure—becomes effortless precision instead of guesswork.

**Part 1 Add-On

Framing Integrity and Grounding Rules**

1. Do not add new problems or consequences that are not present in user inputs.

If inference is needed, mark it as inference.

2. Do not exaggerate stakes.

Every consequence must link logically to the user’s source.

3. Keep framing clean and simple.

No metaphor unless the user’s text implies it.

4. Do not shift the user's intended message direction.

Avoid flipping the goal or moral of the content unless asked.

5. Visual Safety.

If framing implies a scene, avoid adding symbolic elements that did not come from the user.
