

TAILORING DOCTRINE

(Persona, Role, Industry, Culture, Language & Seniority)

1 Purpose of This Part

This part is where empathy becomes engineering.
It systematizes adaptation — shaping the same truth differently for varied personalities, job functions, industries, geographies, and cultural ecosystems.
It also handles linguistic and hierarchical nuance so messages feel natural, not “translated.”

This part answers:
“Who am I speaking to — and how does their world filter what I’m saying?”

2 Meta-Objectives

- 1. Build a multidimensional tailoring framework combining psychological, functional, and cultural intelligence.
- 2. Translate abstract intent into context-anchored phrasing calibrated to audience type.
- 3. Eliminate one-size-fits-all language without fragmenting identity or tone.
- 4. Provide cross-persona conversion maps for product, marketing, leadership, and cross-functional communication.
- 5. Create global adaptability: region-ready, language-fluid, hierarchy-aware messaging.

3 Structural Flow of Part 7

Layer	Title	Function
1	Persona & Behavioral Framing Rules	Encode message logic by personality type and cognitive orientation.
2	Role & Functional Blueprints	Tailor message substance to professional priorities and pain maps.
3	Industry-Level Proof & Language Anchors	Embed vertical specificity — vocabulary, metrics, stakes.
4	Geography & Cultural Sensitivity Grid	Map directness, formality, and emotional expression norms worldwide.

5	Language & Translation Adaptation Laws	Ensure linguistic precision and emotional equivalence across tongues.
6	Seniority, Tenure & Hierarchical Sensitivity Grid	Adjust density, tempo, and framing by authority level and decision horizon.
7	Collective vs Individual Decision Dynamics	Adapt message flow for group-oriented vs autonomous audiences.
8	Multi-Persona Alignment Framework	Build unified messages that resonate across conflicting persona needs.
9	Operational Tailoring Checklist	Provide step-by-step personalization ritual for message finalization.

4 Detailed Descriptions of Each Layer

Layer 1 – Persona & Behavioral Framing Rules

- Integrates behavioral models (DISC, MBTI, RevSync, Persona360).
- Defines six universal persona archetypes: **Analyst, Visionary, Pragmatist, Guardian, Empath, Skeptic**.
- Each archetype mapped by:
 - Cognitive Bias Triggers (data bias, risk bias, ego bias).
 - Preferred Tone (consultative, coaching, assertive).
 - Persuasion Path (proof, possibility, principle, protection, purpose, parity).
- Introduces **Persona Matching Compass**—tool aligning tone intensity and empathy type to persona bias.
- Example: *Skeptic → High proof, low promise; Visionary → High consequence, high imagination.*

Layer 2 – Role & Functional Blueprints

- Tailors language to functional logic:
 - Product roles:** clarity, experimentation, precision.
 - Marketing roles:** emotion, storytelling, customer resonance.
 - Finance roles:** efficiency, numbers, defensibility.
 - Sales/Revenue roles:** consequence framing, urgency, differentiation.
 - Leadership roles:** alignment, vision, risk control, morale.
- Provides **Role Conversion Table** showing how to rephrase the same insight per function.

- e.g., “Speed of learning” → PM: experiment cycle time; CMO: campaign iteration; CRO: time-to-value.

Layer 3 – Industry-Level Proof & Language Anchors

- Creates vertical lexicons—each industry’s decision vocabulary, KPI currency, and credibility anchors.
- For each sector (SaaS, Finance, Healthcare, Retail, Education, etc.):
 - defines top 5 metrics;
 - expected proof types (case, benchmark, ROI range);
 - taboos (phrases that signal outsider ignorance).
- Introduces **Industry Resonance Matrix** linking emotional trigger to functional proof style:
 - Healthcare → empathy-led + compliance-proof.
 - Retail → customer emotion + conversion uplift.
 - Fintech → precision logic + regulatory safety.
 - SaaS → scalability + integration risk.
- Helps messages *sound like they belong* in that world.

Layer 4 – Geography & Cultural Sensitivity Grid

- Maps 20 global regions by five dimensions:
 - **Directness** (explicit vs contextual)
 - **Hierarchy sensitivity**
 - **Formality tone**
 - **Risk communication style**
 - **Humour tolerance**
- Builds **Tone Adaptation Table** for low-context (US, Germany, Nordics) vs high-context (Japan, India, Middle East) cultures.
- Adds *Cultural Reflex Triggers*: phrases or gestures that imply disrespect in one region but assertiveness in another.
- Explains *collectivism markers*—how to signal team value vs individual contribution.
- Produces *Regional Tone Calibration Index* with numeric ranges for energy and warmth.

Layer 5 – Language & Translation Adaptation Laws

- Ensures semantic and emotional equivalence across language systems.
- Defines **Five Translation Anchors**: clarity, rhythm, idiom safety, tone symmetry, emotional persistence.
- Explains linguistic asymmetries:
 - English → abstract-flexible;
 - Spanish → emotive and gendered;
 - French → precision and nuance;
 - Hindi-English → metaphor-rich;
 - Japanese → indirect and hierarchical.
- Introduces *Bilingual Breathing Rule*: keep average sentence $\leq 70\%$ original word count when translating high-context languages to English to preserve readability.
- Provides **Emotion Carry-Over Grid**—mapping which emotional tones survive or collapse in translation.

Layer 6 – Seniority, Tenure & Hierarchical Sensitivity Grid

- Expands and integrates content from Part 6 but within broader cultural context.
- Defines **Experience Quadrants**:
 - Early-career → eager but insecure.
 - Mid-career → pragmatic and skeptical.
 - Senior → strategic and time-poor.
 - Executive → visionary yet risk-averse.
- For each:
 - *Proof Density Ratio* (how much evidence they need).
 - *Tone Distance* (formality gap).
 - *Narrative Horizon* (short-term vs long-term consequence framing).
- Adds *Power Distance Adapter*: algorithm adjusting assertiveness based on hierarchy + culture.
- Demonstrates *Dual Register Technique*: blending upward deference with peer confidence.

Layer 7 – Collective vs Individual Decision Dynamics

- Distinguishes communication for group-consensus vs individual-authority systems.
- Outlines *Message Threading Logic*:
 - Group contexts → seed alignment questions first, conclusion later.
 - Individual contexts → open with stance, support with empathy.
- Introduces **Decision Culture Compass**—classifies organization’s bias toward collective safety vs individual autonomy.
- Shows how to write for reading aloud vs circulation (committee vs owner).

Layer 8 – Multi-Persona Alignment Framework

- Solves the “split audience” problem (e.g., one email CC’d to CMO + CTO + CFO).
- Creates *Three-Layer Message Design*:
 1. **Universal Anchor**: shared problem or consequence.
 2. **Selective Payloads**: micro-lines targeting each persona’s core motivator.
 3. **Unified Closure**: action safe for all roles.
- Defines **Conflict Neutralization Rule**—never use proof type that undermines another persona’s worldview.
- Includes *Harmony Audit Grid*: verifies that message appeals to at least one emotional motivator per persona without contradiction.

Layer 9 – Operational Tailoring Checklist

1. Identify audience persona(s) and decision bias.
 2. Select functional blueprint (role focus).
 3. Load industry lexicon.
 4. Adjust tone via region & hierarchy index.
 5. Translate or rephrase using language anchors.
 6. Apply cultural or collective alignment logic.
 7. Validate through Harmony Audit.
 8. Re-score message using MIMIR Rubric (Part 6).
-

5 Edge Case Coverage

- **Cross-Regional Teams:** blending conflicting tone expectations in a single email.
 - **Multilingual Environments:** ensuring emotional coherence across dual-language drafts.
 - **Industry Hybrids:** e.g., FinTech-Healthcare or SaaS-Education.
 - **Persona Evolution:** adapting message as same person's role or seniority changes.
 - **AI Localization:** using cultural and linguistic metadata to adjust machine output without bias amplification.
-

6 Inter-Dependencies

- Pulls base emotion and tone from Parts 1–3.
 - Relies on message structure and testing tools from Part 6.
 - Provides raw inputs for bias calibration in Part 9.
 - Supplies persona data for narrative and example selection in Part 12 (Narrative Physics).
-

7 Exclusions

- Does not handle structural sequencing (Part 8).
 - Leaves bias correction and feedback evolution to Parts 9 & 10.
 - Does not teach timing logic (handled under Part 8).
-

8 Deliverables from This Part

1. **Persona Matching Compass (PMC).**
2. **Role & Function Conversion Tables.**
3. **Industry Resonance Matrix.**
4. **Cultural Sensitivity Grid (20-Region Index).**
5. **Language Adaptation Handbook.**
6. **Seniority & Hierarchy Sensitivity Matrix.**

7. **Decision Culture Compass.**

8. **Harmony Audit Grid & Operational Tailoring Checklist.**

9 Summary of Intent

Part 7 gives MIMIR its social intelligence — its ability to read the room before speaking.

It converts empathy into logic, ensuring every message respects the worldviews, metrics, and values of those it touches.

When mastered, the communicator develops an almost empathic reflex:

“I no longer write *to* people — I write *from* their angle of reality.”

****Part 7 Add-On**

Persona, Role, Industry, Culture Safety Checks**

1. Do not assume demographics.

Age, region, culture, and seniority must come from user inputs.

2. When adapting, do not create fictional personas or job roles.

3. No industry-specific claims unless the user gives industry context.

4. Do not assign motivations to a persona without evidence.

5. Visual Safety.

Avoid stereotypes in visuals.

Do not imply ethnicity, age, gender unless the user specifies.
